

Purified anti-FAK Antibody

HeLa cells were fixed with 4% paraformaldehyde (PFA) for 15 minutes, permeabilized with 0.5% Triton X-100 for three minutes, and blocked with 5% FBS for 60 minutes. Then the cells were intracellularly stained with 0.5 $\mu\text{g}/\text{ml}$ anti-FAK antibody (clone W16060A) overnight at 4°C followed by Alexa Fluor[®] 594 (red) conjugated goat anti-rat IgG (clone Poly4054) for one hour at room temperature. Nuclei were counterstained with DAPI (blue). The image was captured with a 60X objective.
